There's got to be a better way...

# The Problem

Automation controls and sensors are **inaccessible** and **expensive**.

How can we make them available for **residential** use and provide an **easy-to-use interface**?

# What is BluDAQ

BluDAQ is a Bluetooth Data Acquisition device that monitors environmental attributes including motion, light, humidity, temperature and pressure.

Automation within the device enables setting environmental thresholds.

# Motivation

## **For Everyone:**

- Portability and Mobile Device Integration
- Save money and time with staying informed

## **For Us:**

- Opportunity to utilize new technologies
- Develop new engineering and management skills

# Objective

- Achieve a modicum of success (working prototype)
- Test the limits of our abilities (SMT)
- Develop telekinesis

# The Current Market

- Many networkable sensors available
- Automation systems are too costly for simple tasks
- Modern data acquisition systems tend to lack extensibility and user focus

# Design Requirements

# Requirements

- Easy to use
- Easily interfaced
- Battery Powered
- Motion detection
- Monitor temperature, humidity, pressure, and light
- Fast Wireless Response

# Brief Project Schedule

- Project Proposal (10/11/16)
- Research and Design (10/20/16)
- Requirement/Specification (10/25/16)
- Design Schematic (11/5/16)
- Design PCB layout (11/17/16)
- Firmware\* (11/24/16)
- Software Application\* (11/23/16)
- Assemble Parts (11/29/16)
- Create Final Presentation (12/5/16)

\* Software/firmware started Concurrently with layout design.

# Our Design

# Our Approach

## Inputs:

- Power
- Bluetooth (Serial / UART)
- Push Button
- Sensor Array (I2C)
  - Temperature
  - Humidity
  - Pressure
- Photodiode
- PIR Motion Sensor

## Outputs:

- Bluetooth Serial
- SPST Relay

# Product Features

- Bluetooth connectivity
- IOS app
- Rechargeable built-in battery
- (2x) User-accessible SPST relays
- Programmable automation tasks
- Sensors:
  - Motion Sensor
  - Temperature Sensor
  - Humidity Sensor
  - Pressure Sensor
  - Light Sensor

**SHUT UP,  
AND TAKE  
MY MONEY!**

# IP and Prior Work

- Adafruit
  - Relays
- Sparkfun
  - Power management
  - LiPo charger
  - Boost converter

# Contributions

Concept Generation

Design

Schematic

Layout, Bill of materials, Parts

Assembly

Coding

# Hardware Design

# Level 0 Block Design

# Firmware Design

**For Power Usage**  
Poll Freq. Could be set to 0 via ISR set to monitor STS and PIR pins.  
(attach interrupt to STS and PIR)

# Implementation

## Power Management 1) Battery Charger

## QME280 Sensor Array-12C

## External MCU Connections

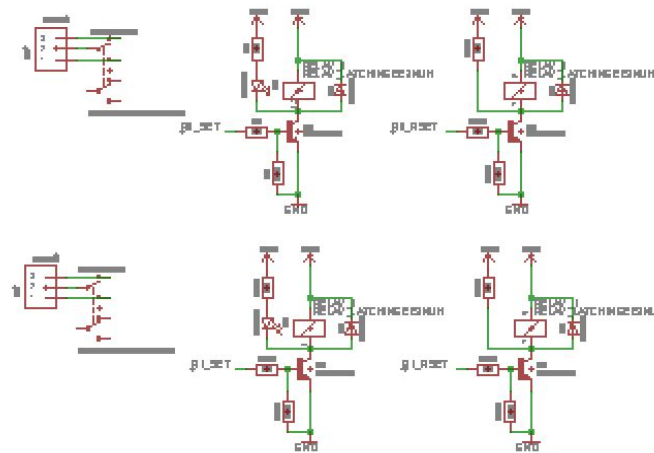

## Power Source Selection

## ATmega328P MCU

## Relay Control

# Prototyping

so fabe

# Layout

- Many components, very tedious
- Many schematic modifications
  - Lots of rerouting

# Bill of Materials

- Total Project Cost: \$403.13
- Money Lost: \$100
- Expensive Parts: LiPo Battery, PCB Board, BME280, BLE
- Low Volume Cost: \$80.90
- Production Run Cost: \$64.72
- Time

# Testing

# Hardware

- Built disconnected from power supplies
- Checked power supplies before connecting to rest of board
- Test with voltage meter

# Hardware Test Results

- Bad Power Supplies
- Strange grounding behavior

# Firmware

- Bluetooth Connection
- Host Authentication
- Serial Communication with IOS application
- Reading sensor values
- Automation

# Problems

- Relays not switching on PCB. (Current problem?)
- Automation

# More Problems

- Fun with datasheets!
- Strange ground behavior

# Lessons Learned

- Select bigger chips (BME280, Boost Converter)
- Check parts availability before using in design
- Triple check before ordering. Twice.
- Use cheaper components (BME280)

# Lessons Learned

- More test pads & in better places
- Laser Cutting
- Enhanced Soldering skills
- Github
- More vias for flooded ground
